

Elliott Gregory Dehnbostel

Senior Software Engineer + AI Engineer

ROLES

JobScream.com 2024-Current (Remote/Cinci) *Founder & CEO / AI Engineer*

Built an AI-native job search engine that ranks every listing against a candidate's resume and emails a daily digest of only the strongest matches. **Bootstrapped to \$30K ARR** over two years with no outside capital and no paid acquisition. Conceived of, designed and developed the product full-stack. Trained and integrated **custom neural networks**.

Econia Labs 2023 (Contract) (Remote/NYC) *Senior Software Engineer*

Researched and developed an upgraded version of the firm's Decentralized Limit Order Book technology, which eliminated the need for minimum order sizes. This made it possible to fill an unlimited number of orders in a single transaction, and enhanced composition by enforcing a single canonical market for every asset pair. Built infrastructure to index and service the production exchange.

Meta: 2021-2022 (Layoff) (Remote/NYC) *Senior Software Engineer*

Designed, delivered and validated at least \$2.5M in server capacity and wall-time savings. Added value to critical infrastructure with novel approaches, while ensuring service stability. Leveraged static analysis and code generation to surface new opportunities. Established detection & documentation necessary to prevent privacy-harming patterns from entering production, each of which would otherwise directly undermine current and future existential technical developments in privacy.

Circle Financial: 2020-2021 (Remote/Cinci) *Software Development Engineer*

Developed an automatic customer billing system as a replacement for the manual approach already in use. Worked with a wide variety of stakeholders such as Legal, Sales, Finance and Engineering. Achieved on-time production deployment by anticipating and designing for frequent changes to requirements, which provides the business with greater agility in growth-hacking endeavors.

Garmin: 2019-2020 (Kansas) *Software Development Engineer*

Developed both a distributed API serving millions of smart watch users per day and its associated customer support tool. Doubled test coverage by contributing a rule-driven arbitrary data initialization framework, which reduced flakiness and maximized passive fuzz-testing. Contributed to onboarding and overall support of new engineers.

SUMMARY

Operates across the full stack—distributed infrastructure, product engineering, mechanism design, capital markets—with a bias toward problems where technical depth unlocks business leverage. Strongest in the gap between “it works” and “it works at scale.” Experienced with cryptocurrency protocols & from-scratch AI training, delivery, governance.

PRODUCTION EXPERIENCE

AREAS	Distributed Web Services, Performance & Efficiency Optimization, Scripting/Automation, Static Analysis, Code Generation, Mobile/Web Products & Internal Tools, Blockchain Applications
TOOLS	Version Control, AWS/GCP, Python, Rust, Java, PHP/Hack, Solidity, Dart, Memcached, SQL/NoSQL, GraphQL, JS/HTML/CSS, C++, C, $\LaTeX$

PERSONAL PROJECTS

- 2024 **Decentralized Limit Order Protocol**
Designed and prototyped an on-chain limit order book protocol with constant cost of execution and MEV resistance, to service the problem of trading real world securities on a public blockchain.
- 2022 **lodis (link)**
Tiny Rust-based HTTP server framework wrapper that delivers process resilience and continuous integration with local compute resources.
- 2020 **/u/lit.word.bot (link)**
Reddit bot which finds and defines interesting and challenging words such as “Codger” and “Mahout.” Top 2% bot by popularity!

EDUCATION

- 2014-2018
GPA: 3.6 **The Ohio State University**
COMP. SCI. & ENGINEERING
Artificial Intelligence Focus
